

POD|LCA Grasshopper interface setup

Introduction

This documentation helps to install and use material tool in Grasshopper environment.

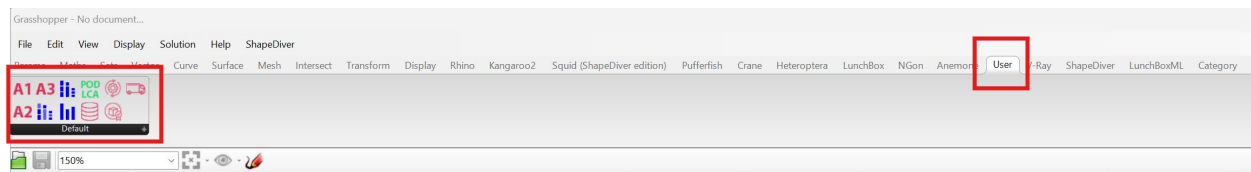

- 0- Installing Rhino 8 (windows or mac)
- 1- Downloading or cloning the [GitHub repo](#)
- 2- Installing essential libraries (Pandas, Numpy, Matplotlib)
 - You may already have installed these libraries in different environments, but you have to install separately for Rhino8.

Open the terminal (CMD) > change directory to this path

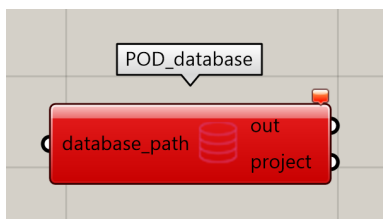

And type `pip install "library name"`

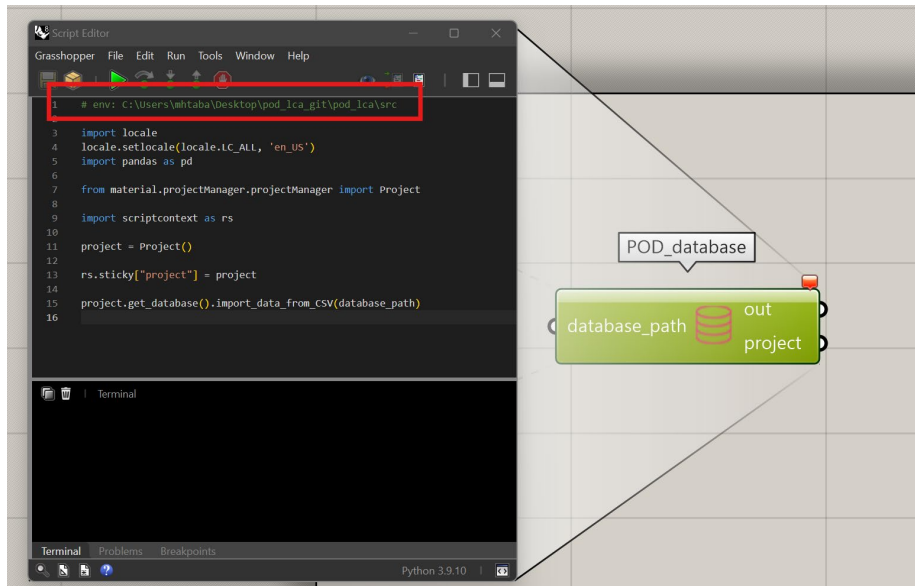

- 3- Copy all the user objects from "Github repo/src/Grasshopper/Userobjects" and paste to "C:\Users\mhtaba\AppData\Roaming\Grasshopper\UserObjects"
- 4- Now when you open the grasshopper you will see the components in user tab.

- 5- To use other components and importing the dataset you should add this component "POD_dataset" first

Double click on the icon in the middle of the component see the python code > change the path based on the repo location on your machine

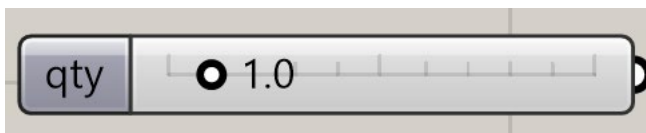

Now save and close this tab.

6- Now, it's ready to use.

Some basic hints for using Grasshopper:

number slider: Double click on the canvas and type a number

- To edit the range and types of number > right click on the slider > Edit

String: Double click on the canvas > panel

File path: Option 1. Copy the file path in the panel

Option 2. Double click on the canvas > file path > Right click > Select new file location
